correction

Why we need topology
in image segmentation?

Image segmentation is a **topological operation** of making an image into multiple disjoint regions. The goal of segmentation is to simplify and/or change the representation of an image (functional data) into discrete states.

Group 0: patients who got improved after one month (n1=58)

Group 1: patients who didn't get better (n2=23)

Question: How we discriminate the groups?

Two sample test without smoothing

$$t = \frac{\bar{x}_1 - \bar{x}_2}{\sqrt{s^2 \left(\frac{1}{n_1} + \frac{1}{n_2} \right)}} \sim t_{n_1+n_2-2}$$

$$s^2 = \frac{\sum_{i=1}^{n_1} (x_i - \bar{x}_1)^2 + \sum_{j=1}^{n_2} (x_j - \bar{x}_2)^2}{n_1 + n_2 - 2}$$

Group 1

Topology correction in segmentation

Hole & handles
corrected using
Euler characteristic

Volume rendering of a mandible from CT
Holes and handles in binary volume

By checking the **Euler characteristic** of the binary volume of a mandible, holes in the binary volume can be detected. This process is necessary to make the mandible binary volume to be topologically equivalent to a solid sphere.

Genus = the number of holes in a surface or an object.

Euler characteristic with convex polyhedrons

Polyhedron is a solid object with polygonal faces, edges and nodes.
Euler characteristic: $EC = N - E + F - \dots$

$$\begin{aligned} EC &= N - E + F \\ &= 4 - 4 + 1 \\ &= 1 \end{aligned}$$

If there is no face

$$\begin{aligned} EC &= N - E \\ &= 4 - 4 \\ &= 0 \end{aligned}$$

$$\begin{aligned} EC &= N - E + F - V \\ &= 4 - 6 + 4 - 1 \\ &= 1 \end{aligned}$$

If there is no volume

$$\begin{aligned} EC &= N - E + F \\ &= 4 - 6 + 4 \\ &= 2 \end{aligned}$$

Question: Check if we have $EC = \text{\#dimension} - \text{\#hole}$
EC is an approximate measure of data dimension!

Computing Euler characteristic of 3D objects

Topologically
equivalent
Deformation-invariant

Sphere

$$\begin{aligned} EC &= N - E + F \\ &= 8 - 12 + 6 \\ &= 2 \end{aligned}$$

Solid ball

$$\begin{aligned} EC &= N - E + F - V \\ &= 8 - 12 + 6 - 1 \\ &= 1 \end{aligned}$$

Computing Euler characteristic by parts

Cover an object
with polyhedrons

$$\begin{aligned} EC &= N - E + F \\ &= 4 - 4 + 1 \\ &= 1 \end{aligned}$$

$$\begin{aligned} EC &= N - E + F \\ &= 4 - 5 + 2 \\ &= 1 \end{aligned}$$

$$\begin{aligned} EC &= N - E + \\ &\quad F \\ &= 6 - 7 + 2 \\ &= 1 \end{aligned}$$

$$\begin{aligned} EC &= N - E + \\ &\quad F \\ &= 7 - 8 + 2 \\ &= 1 \end{aligned}$$

Computing Euler characteristic by parts

Cover an object
with polyhedrons

**Incorrect
computation**

$$\begin{aligned} EC &= N - E + F \\ &= 8 - 8 + 1 \end{aligned}$$

$$\begin{aligned} EC &= N - E + F \\ &= (8+4) - (8+6) + \\ &\quad (1+1) \end{aligned}$$

$$\begin{aligned} EC &= N - E + F \\ &= 8 - (8+2) + \\ &\quad (1+1) \end{aligned}$$

$$\begin{aligned} EC &= N - E + F \\ &= (8+2) - (8+4) \\ &\quad + (1+1) \\ &= 0 \end{aligned}$$

Iterative computation (online) of Euler characteristic

| | | | | | |
|-------------|---|---|----|---|---|
| # neighbors | 1 | 2 | 2 | 3 | 4 |
| # Vertex | 2 | 1 | 0 | 0 | 0 |
| # Edge | 3 | 2 | 2 | 1 | 0 |
| # Face | 1 | 1 | 1 | 1 | 1 |
| EC change | 0 | 0 | -1 | 0 | 1 |

Question: Given binary image, write an iterative algorithm

Computing Euler characteristic in 3D image

(a) $8 - 12 + 6 - 1 = 1$

(b) $16 - 28 + 16 - 3 = 1$

(c) $32 - 64 + 40 - 8 = 0$

(d) $48 - 100 + 64 - 13 = -1$

(e) $56 - 120 + 78 - 16 = -2$

(f) $64 - 144 + 108 - 26 = 2$

Partition search region into voxels.

$$EC = \# \text{ vertices} - \# \text{ edges} + \# \text{ faces} - \# \text{ volume}$$

Euler characteristic: most widely used topological invariant

A 2D grid of blue dots with a cyan polygonal region. The region's boundary is marked by pink dots connected by pink lines. Red dots are located inside the cyan region.

A photograph of four King penguins standing on a sandy beach. The penguins are facing away from the camera, looking out towards the ocean. They have white bodies, black heads and backs, and a distinctive yellow-orange patch on their chests. The beach is light-colored sand, and the ocean has white-capped waves breaking in the distance under a clear blue sky.

The marching cubes algorithm will extract the boundary of binary segmentation

Marching cubes algorithm

Depending on the amount of partial vacuuming, we connect the centers of cubes

Marching cubes algorithm in 3D

Cell consists of 8 voxel values:

1. Classify each vertex as inside or outside
2. Build an index
3. Compute edge list from `table[index]`
4. Determine vertex coordinates
4. Go to next cell

Marching Cubes

Use the binary labeling of each voxel vertex to create an index

Marching Cubes

All 256 cases can be derived from $1+14=15$ base cases due to symmetries

Invented by Carl Crawford (GE's Medical Systems Business Group). Expert on CT reconstruction.

Table

Marching cubes in MATLAB

FV =

`isosurface(X,Y,Z,V,ISOVALUE)`

computes isosurface geometry for data V at isosurface value ISOVALUE.

Optional: arrays (X,Y,Z) specify the coordinates at which the data V is given. The struct FV contains the faces and vertices of the isosurface and can be passed directly to the PATCH command.

It is based on simpler version of marching cubes.

2D surface model of left amygdala using marching cubes algorithm

Matlab
demo

Euler characteristic for a surface mesh

How to check the topologically defect of a surface?

$N - E + F = 2$ for a surface topologically equivalent to a sphere.

For each triangle, there are three edges. Since two adjacent triangles share the same edge, the total number of edges is

$E = 3F/2$. Hence, we have $F = 2N - 4$ for a closed surface.

Advanced topology problems

Hot spots conjecture [Chung et al. 2011 MLMI](#)

$$K_{\sigma} * f(p) = \underbrace{\frac{\int_{\mathcal{M}} f(p) d\mu(p)}{\mu(\mathcal{M})}}_{\text{Mean signal}} + \underbrace{f_1 e^{-\lambda_1 \sigma} \psi_1(p)}_{\text{Topology term}} + R(\sigma, p)$$
